GastroPanel®

What is GastroPanel?

A finger-prick blood test that helps clinicians identify which patients with stomach symptoms need a gastroscopy and which don't.

Results available
in 15 minutes

Negative predictive value
of 91%

Detects *H. pylori* and
atrophic gastritis

No laboratory required –
point of care testing

GastroPanel measures
four gastric biomarkers
to assess the condition
of the gastric mucosa.

4X gastric
biomarkers

Pepsinogen I

Pepsinogen II

Gastrin-17

H. pylori antibodies

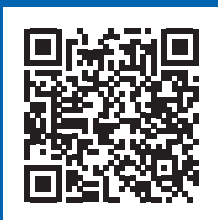

Triage before you scope.

Too many patients are waiting for a procedure they don't need.

When all patients with stomach symptoms follow the same pathway to gastroscopy, low risk patients can delay care for those who need it most.

GastroPanel helps clinicians rule out the need for gastroscopy before any decision to scope is made – reserving it for those who genuinely need it.

'Rethinking Gastroscopy referrals in the UK – is it time for triage?'

Scope with confidence.

Results that inform better gastroscopy.

For patients who test positive, GastroPanel's biomarker results equip clinicians to approach the gastroscopy with greater focus and precision – knowing where to look and what to look for.

Reduces risk of missed diagnoses

Guides clinicians to areas of concern

Better outcomes for patients who need further investigation

Transform your pathway.

Reduce costs and free up
endoscopy capacity.

Gastroscopy is a resource-intensive procedure requiring a team of clinical and administrative staff. As demand on endoscopy units continues to grow, the pressure on services, budgets and waiting times increases.

GastroPanel introduces a simple point-of-care triage step before any decision to scope is made – reducing unnecessary procedures and freeing up capacity at every stage of the pathway.

- ✓ Frees up endoscopy capacity
 - ✓ Reduces cost and clinical time across the pathway
 - ✓ Cost-effective point of care testing
